Learning outcomes:					
Class syllabus: Mechanics: Procedure is largely based on the scalar quantities: kinetic energy, potential energy, virtual work and in many cases the power function. Each of these can be expressed, usually without difficulty, in any suitable coordinates. Of course the vector nature of force, velocity, acceleration etc., must be taken account of in the treatment of dynamical problems. Fortunately the basic idea involved in the derivation of Lagrange's equations are simple and easy to understand. The application of Lagrange's equations to actual problems is remarkably simple even for systemswhich may be quite complex. Except for very elementary problems, the procedure is in general much simpler and less time consuming than the than the "concise", "elegant" or special methods found in many current (physical) texts. During the lecture are presented as well as the examples, problems and suggested experiments.

Class syllabus: We present the concepts of "state of a system" and the "eigenstate", which then straightforwardly lead to the basic equation of motion, i.e. to the Schroedinger equation; and, by way of a number of classic, historically important observations concerning the quantization of the systems and the various radiation laws, we infer the duality of waves and particles. Quantum mechanics is then further developed with respect to the fundamental problems (uncertainty relations, quantization of classical systems, spin, etc.); applications as the harmonic oscillator, hydrogen atom, hydrogen-like atoms and a lot of examples and exercises.
