COURSE DESCRIPTION

Academic year: 2021/2022					
University: Comenius University Bratislava					
Faculty: Faculty of Mathematics, Physics and Informatics					
Course ID: FMFI.KEF/1-FYZ-232/15		Course title: Advanced Programming			
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 1 / 2 per level/semester: 13 / 26 Form of the course: on-site learning					
Number of credits: 4					
Recommended semester: 4.					
Educational level: I.					
Prerequisites:					
Course requirements: Continuous assessment: elaboration of homework for individual lectures. Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 100/0					
Learning outcomes: The graduate of the course will acquire the skills necessary for the numerical solution of simple physical problems and will learn the basic algorithms of numerical calculations.					
Class syllabus: Numerical stability of simple iteration schemes. Transition from a continuous problem to a discrete one. Numerical solution of the wave equation. Nonlinear iteration schemes. Numerical calculation of integrals. Random numbers. Differential equations: Runge-Kutta methods. Systems of differential equations. Simple physical models, firing method, time evolution of nonlinear physical models, Brownian motion. Simple integral equation, Optimization.					
Recommended literature: W. H. Press et al.: Numerical Recipes. Cambridge Univ. Press, 1992					
Languages necessary to complete the course: Slovak, English

Prerequisites:	
Course requirements: Continuous Assessment (100%): home assignments 40points, test 60points Approximate scale of final grades: A 91%, B 81%, C 71%, D 61%, E 51% Continuous Assessment / Final Examination: 100/0 Scale of assessment (preliminary/final): 100/0	
Learning outcomes: The student will gain basic knowledge of astronomy and astrophysics - the basics of spherical astronomy, celestial mechanics, the planetary system, the formation and evolution of stars, galaxies and galactic systems. After completing the course, students will be sufficiently prepared to continue in the master's degree in astronomy and astrophysics.	
Class syllabus: Subject of astronomy; coordinate systems, transformations of coordinate systems; time and calendar, types of time, refraction, aberration, parallax, precession, nutation, self - movement of stars, position reductions, catalogs and yearbooks; two-body problem, equations of motion, Kepler's laws, velocities, anomalies, Kepler's equation, trajectory elements; solar system - structure, geocentric orbits, physical characteristics of solar system bodies - methods of determination, inner planets, Earth-Moon, outer planets, small bodies of the solar system - comets, asteroids, meteorites, meteors, interplanetary dust; formation and development of the solar system. Radiation in astrophysics. Boltzman's equation, Sah's equation. Magnitudes of stars, Pogson's equation, temperature of stars, spectral classification, Herzsprung-Rusell diagram. Binary stars, determination of the mass of stars, rotation of stars, magnetic fields of stars. The relationship between mass and luminosity, determining the dimensions of stars. Variable stars. Interstellar matter - gas, dust, molecules. Galaxy and galaxy.

Educational activities: Type of activities: lecture / laboratory practicals Number of hours: per week: 3 / 3 per level/semester: 39 / 39 Form of the course: on-site learning	
Number of credits: 7	
Recommended semester: 5.	
Educational level: I., II.	
Prerequisites:	
Course requirements: Continuous assessment: work on practical exercises (100%). The condition for granting credits is the presentation of a semester project. Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 100/0	
Learning outcomes: The student will understand the principles of using basic building blocks (resistor, inductance, capacitance, diode, transistor) in digital and analog circuits. They will understand the principles and use of basic digital and analog circuits (gates, counters, timers, operational amplifier, A / D and D / A converters, Arduino microprocessor system), principles of generating harmonic and non-harmonic signals and linear and pulse power supplies. They will be able to analyze basic circuits and use them to design simple electronic circuits with the required functionality. He will also gain practical experience with the construction and revitalization of simple electronic circuits.	
Class syllabus: Semiconductor diode and transistor and their basic connections. Transistor in switching mode, TTL digital circuits and their use. Basic logic circuits. Comparator. Timer 555. D / A and A / D converters. Arduino microprocessor system. Nodal potential method. Analysis of linear circuits in time and frequency domain. Linear model of transistor and operational amplifier. Basic circuits with operational amplifier. Positive feedback and oscillator principles. Power supplies and rectifiers.

Recommended semester: 6.	
Educational level: I.	
Prerequisites:	
Course requirements: Continuous assessment: homework Exam: oral The evaluation of the subject takes place in the form of continuous (individual work) and final evaluation (oral exam). Successful completion of the course reflects the student's sufficient orientation in the issue. The course will be graded as provided the student demonstrates compliance with at least 51%. The conditions for successful completion of the course are in accordance with the Study Regulations of FMFI UK Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 51% Scale of assessment (preliminary/final): Weight of the intermediate / final evaluation: 30/70	
Learning outcomes: Understand the importance of quantum mechanical description of substances at the molecular level - the basis of theoretical approaches to the study of their reactions. Subject of interest - quantum mechanical description of molecules and their aggregates. To master the practical tasks of solving the electron shell of molecules using current methods of quantum chemistry.	
Class syllabus: Standard molecular Hamiltonian. Atomic system of units. Born - Oppenheimer approximation. Potential energy surface (curve). Solution of the electron Schrodinger equation MO-LCAO approximation. Electron repulsion - model of independent particles. Huckel approximation, Hartre approximation, Hartree-Fock approximation, Coulomb and exchange integral. Practical applications for solving the structure of molecules. Nuclear Schrodinger equation, its solution for diatomic molecules. Model rigid rotor-harmonic oscillator, separation of vibrational and rotational motion and processing of their interaction. Practical demonstration - calculation of spectroscopic constants of a selected diatomic molecule. Rotation of polyatomic molecules, rotational levels, rotational constants. Vibrations of polyatomic molecules - vibrational levels, normal modes. Symmetry of molecular systems. Dynamic aspects of molecular systems. Transition state methods, collision theory, quasiclassical trajectory method. Environmental influence - methods of solvation

Prerequisites:	
Course requirements: Continuous assessment: solving tasks Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 100/0	
Learning outcomes: After completing the course, the student will be able to apply current methods of computer simulations to effectively solve a wide range of problems in various fields of classical physics. The student will also be able to analyze, visualize and interpret the results obtained from simulations. The focus is on molecular dynamics and Monte Carlo methods, and an important part of the course is the solution of complex optimization problems that often occur in science and in everyday life. As part of practical exercises, the student will gain experience with the application of lectured methods on clusters, crystals and fluids, including phase transitions. The student will also get acquainted with computer simulations of seismic wave fields using the finite difference method.	
Class syllabus: Use of computer simulations in physics - experiment, theory, simulations Mean values and fluctuations Ergodic theorem Molecular dynamics (MD) Classical description of interactions - force field Periodic boundary conditions, cutoff of interactions, Ewald summation for Coulomb potential MD at constant temperature and pressure, MD for molecular systems Simulation data processing - statistical error estimation Calculation of time correlation functions, connection with physical quantities MC - simple sampling, importance sampling, detailed equilibrium principle, Metropolis algorithm Optimization algorithms for complex problems - simulated annealing, evolutionary algorithms Free energy calculations, phase transitions, activated processes Quantum Simulations - Path Integral Monte Carlo Principles of finite difference method (KD), KD network, KD approximations, KD schemes, stability analysis	

KD schemes for 1D elastic problem, material interfaces, free surface, computational domain boundaries, wave field excitation

Learning outcomes: The objective of the subject is to provide the students with experience and knowledge of technical English and thus make them ready to use English sources of information for later study and professional career.	
Class syllabus: On entering the first semester, students' knowledge of English is tested and they are divided into groups according to the results of the placement test. In the groups of pre-intermediate and intermediate students, fundamentals of technical English are taught. Advanced students take classes of technical English for their field of study: English for mathematics, for physics, for computer science, English for management and economic and financial mathematics.

University: Comenius University Bratislava	
Faculty: Faculty of Mathematics, Physics and Informatics	
Course ID: FMFI.KEF/1-FYZ-212/15	Course title: Fundamentals of Programming
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 2 / 2 per level/semester: 26 / 26 Form of the course: on-site learning	
Number of credits: 5	
Recommended semester: 3.	
Educational level: I.	
Prerequisites:	
Course requirements: Exam: practical (programming) Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 0/100	
Learning outcomes: The student will understand the principles of computer processing of numbers and the resulting limitations (data types, including links, number fields). They will understand the basic structures of the program (functions, branches, ...) and their use to algorithmize problem solving. They will be able to program in C / C ++ language simpler algorithms for solving mathematical and physical problems (eg movement in fields, calculation of fields, sums of rows, ...).	
Class syllabus: Basic structure of C / C ++ program, data types and their accuracy, program branching (if..else, switch, for, while, do..while), functions, use of references to return multiple values of functions, two- and multidimensional fields, texts , field references, data flows and their control (cin, cout), working with files (fstream), concept of object, drawing simple graphs from C ++ program (xmgrace, GNUplot), Euler's method for solving differential equations and its use for solving motion problems , roots of functions, numerical integration and its use for solving physical problems, random numbers and Monte Carlo methods, basics of object-oriented programming.

Educational activities: Type of activities: practicals Number of hours: per week: 2 per level/semester: 26 Form of the course: on-site learning					
Number of credits: 2					
Recommended semester: 1.					
Educational level: I., II.					
Prerequisites:					
Course requirements: Scale of assessment (preliminary/final): 100/0					
Learning outcomes: To master the fundamentals of the common language and basic technical terms of particular fields of study (depending on the student's level of German proficiency)					
Class syllabus: German language is taught at three levels: beginner, intermediate and advanced. Students opt for one of them depending on whether they need to learn the fundamentals or maintain and/or improve their previous knowledge. This course's focus is to master the fundamentals of the common language and basic technical terms of particular fields of study (depending on the student's level of German proficiency)					
Recommended literature: Appropriate study material is supplied by teacher based on the participants'level of German proficiency.

COURSE DESCRIPTION

Academic year: 2021/2022	
University: Comenius University Bratislava	
Faculty: Faculty of Mathematics, Physics and Informatics	
Course ID: FMFI.KEF/1-FYZ-451/15	Course title: Introduction to Plasma Physics and Electrical Discharges
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 4 / 2 per level/semester: 52 / 26 Form of the course: on-site learning	
Number of credits: 7	
Recommended semester: 6.	
Educational level: I.	
Prerequisites: FMFI.KEF/1-FYZ-211/17 - Electromagnetism and Optics or FMFI.KEF/1-TEF-204/22 - Electricity and Magnetism	
Course requirements: Continuous assessment: no Final: test, exam Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 0/100	
Learning outcomes: In the course, students will gain basic knowledge of plasma physics and electrical discharges, which are necessary for successful completion of the bachelor's thesis in the area. After completing the course, students will be able to easily orient themselves in the studied issues, as they will have basic knowledge about plasma, its occurrence, generation methods, mechanisms of electric discharges, their application and plasma diagnostics. Upon successful completion of the course, students will be knowledge-ready for a possible master's degree in Plasma Physics.	
Class syllabus: <ol style="list-style-type: none"> 1. Plasma - 4th state of matter, natural occurrence of plasma, "quasineutrality" of ionized gas, methods of plasma generation (various types of electric discharges in gases), application of glow, corona and arc discharges. 2. Debye-Hückel theory of charge shielding: collective phenomena of particles, plasma polarization, shielding of el. field of inserted charge, shielded potential, Debye length, Debye sphere - ideal, non-ideal plasma. 3. Plasma charge fluctuation, quasi-neutrality of plasma, exact definition of plasma; plasma oscillations, plasma frequency. 4. Elastic and inelastic collisions of particles in plasma, mean free path of gas particles, collision frequency, effective collision cross section, reaction coefficient, elementary processes in plasma. 5. Excitation and ionization by electron-ion interaction, differential ionization, particle ionization collision cross section; radiation ionization and excitation, resonant radiation, diffusion of radiation, radiation absorption, effective photon collision cross section; thermal ionization and excitation, degree of ionization, Saha equation, binary gas, degree of excitation and Boltzmann's law. 	

6. Dissociative ionization, Townsend (first) ionization coefficient, ionization function, Wannier equation; negative ion formation, electron affinity, electronegative and electropositive gases, dissociative attachment, three-particles attachment, transient negative ion (TNI); reaction coefficient, reduced el. field.
 7. Particle recombination - spatial, on electrodes, on the wall (conductive, non-conductive); negative ion extinction; spatial recombination, recombination factor of electrons with positive ions.
 8. The movement of particles in el. field (drift), charged particle mobility, drift velocity; particle motion under the influence of concentration gradient (diffusion), Fick's law, Einstein's relation; Ambipolar diffusion.
 9. Statistical theory of el. discharges, statistical model of electron avalanches, statistical model of el. discharges.
 10. Streamer concept, Boltzman kinetic equation and Monte Carlo method.
 11. El. Discharges at high pressure, corona discharge, corona discharge in applied electrostatics, primary and secondary streamer.
 12. Dielectric barrier discharges, glow discharges at atmospheric pressure, surface activations of polymeric materials in various types of el. discharges.
 13. Spark and arc discharge, el. discharges in liquids.
 14. Plasma diagnostics, single and double probe (determination of electron concentration and temperature), optical emission spectroscopy, atomic spectra (determination of electron temperature from the ratio of intensity of spectral lines), molecular spectra (determination of rotational temperature spectra), actinometry, laser absorption spectroscopy, corpuscular spectroscopy, CRDS spectroscopy.
 15. Examples of plasma application use: in metallurgy, in surface treatment of materials, environmental protection, light sources, thermonuclear fusion.
- During the practical part of subject, computational tasks on the topic will be solved and additional (time-consuming) mathematical definitions of some physical relations and laws of lectures will be performed. Students will gain and acquire knowledge of the basics of modeling in plasma physics, and within the demonstration experiments of individual electric discharges, they will actually get acquainted with the instrumentation of laboratories. They will also get acquainted with diagnostic methods used in plasma physics - optical emission spectroscopy, probe methods, microwave methods, mass spectroscopy.

University: Comenius University Bratislava	
Faculty: Faculty of Mathematics, Physics and Informatics	
Course ID: FMFI.KMANM/1- FYZ-120/17	Course title: Mathematics (1)
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 5 / 3 per level/semester: 65 / 39 Form of the course: on-site learning	
Number of credits: 9	
Recommended semester: 1.	
Educational level: I.	
Prerequisites:	
Course requirements: Interim assessment: During the semester, there will be five written examinations for a total of 65 points. The student has the opportunity to obtain another 35 points for working on the exercises according to the instructions of the professional assistants who lead them. The student needs to get at least 60 points for work during the semester. Exam: The exam consists of a written and an oral part. Indicative assessment scale: A 92%, B 84%, C 76%, D 68%, E 60% Scale of assessment (preliminary/final): 50/50	
Learning outcomes: The student will learn the basics of differential and integral calculus of functions of one real variable.	
Class syllabus: Real and complex numbers, sequences and their limits, completeness and square root of a positive real number, numerical infinite series, exponential function, functions of a real variable and their limits, continuity and properties of continuous functions, elementary functions (power function, logarithm and trigonometric functions).	
Recommended literature: Analysis 1: Forster Otto, Vieweg, Springer Spektrum, 2015 Mathematics 1: For the study of technical sciences / I. Kľuvánek ... [et al.]. Number of credits: 2	
Recommended semester: 4.	
Educational level: I.	
Prerequisites:	
Course requirements: Work during semester: homework and problem solution in the class. Weight of the exam: 0%. Scale of assessment (preliminary/final): 100/0	
Learning outcomes: Students will learn how to approach problems without any context of a given topic in the particular class. They will refresh the basic ideas and approaches from the first three semesters of the program, which are common across the areas of physics, and will learn several new ones.	
Class syllabus: The course is aimed at solving physics problems of various topics and difficulty. Sometimes those are problems that illustrate a specific approach to a class of physics problems, sometimes they are more aimed at recalling basics procedures in some area of physics. The main difference from the standard exercise sessions is that the problems come without any context of a particular subject and topics, thus the best approach to solving the problem is not given. In the first installment of this class we look at topics from the first three semesters.

Academic year: 2021/2022	
University: Comenius University Bratislava	
Faculty: Faculty of Mathematics, Physics and Informatics	
Course ID: FMFI.KAFZM/1-FYZ-477/19	Course title: Physics of the Planet Earth
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 4 / 2 per level/semester: 52 / 26 Form of the course: on-site learning	
Number of credits: 7	
Recommended semester: 5.	
Educational level: I.	
Prerequisites:	
Antirequisites: FMFI.KAFZM+KAMŠ/1-FYZ-476/15	
Course requirements: Continuous assessment based on discussions. Scale of assessment (preliminary/final): 100/0	
Learning outcomes: Students will gain basic knowledge about the structure and physical processes in the Earth and the surrounding space. The explanation of these processes will be based on the knowledge gained in basic physics courses (mechanics, electricity and magnetism, electromagnetic field theory, thermodynamics).	
Class syllabus: <ol style="list-style-type: none"> 1. How the Earth originated and what is its internal structure. 2. Tides and dynamics of Earth-Moon coexistence. 3. Seismic waves and the most precise physical model of the Earth. 4. Why has the Earth its magnetic field? What will be the magnetic field in future like? 5. Electric currents in the Earth and its surroundings. Electromagnetic sounding of the Earth. 6. Measurements of physical parameters - from archeologic findings to the deep Earth's interior. 7. Excursion 8. Earthquakes, tsunami and seismic hazard. 9. Earthquakes induced by human activity and the increase of seismic hazard. 10. Aurora, ionosphere and magnetosphere of the Earth and planets. 11. Electromagnetic resonances in the Earth's atmosphere. 12. Sources of heat and heat flux in the Earth. Is the Earth going to overheat or is it growing cold?

Academic year: 2021/2022	
University: Comenius University Bratislava	
Faculty: Faculty of Mathematics, Physics and Informatics	
Course ID: FMFI.KEF/1-OZE-211/15	Course title: Practical I
Educational activities: Type of activities: laboratory practicals Number of hours: per week: 3 per level/semester: 39 Form of the course: on-site learning	
Number of credits: 4	
Recommended semester: 3.	
Educational level: I.	
Prerequisites:	
Course requirements: Continuous assessment: preparation for the practice, writing of reports from individual tasks Indicative assessment scale: A 90%, B 80%, C 70%, D 60%, E 50% Scale of assessment (preliminary/final): 100/0	
Learning outcomes: Improvement and use of theoretical knowledge of mechanics and molecular physics, mastering basic physical measurement methods. The student will master the basic habits of independent scientific work in physics research: working with literature, laboratory protocol, obtaining experimental erudition, critical evaluation of measurement and physical interpretation of processed results, written processing of individual physical problems in the form of a paper.	
Class syllabus: In practice, students will gain skills in experimental verification of basic physics laws (Gravitational Law, Hooke's Law, Ideal Gas Law,...), quantitative investigation of physical events (state changes, oscillations, polytropic process,...) and measurement of some basic physical quantities (modulus of elasticity, density, viscosity, speed of sound, humidity, surface tension, gravitational constant, gravitational acceleration,...). Tasks: Density measurement. Measurement of modulus of elasticity. Vibrations of coupled pendulums. Measurement of gravity acceleration. Moment of inertia measurement. Gravitational constant measurement. Heat capacity measurement. Evaporation heat measurement. Determination of dynamic viscosity of fluids. Measurement of dynamic viscosity of liquids by commercial viscometers. The fall of a sphere in a confined gaseous environment. Polytropic process. Determination of surface tension of liquids. Measurement of relative and absolute humidity. Measuring the speed of sound in air. Basic properties of oscillating motion. Some tasks are equipped with sensors allowing measurement and processing of data by computers. For some tasks, conventional measuring instruments and aids are used.

Recommended prerequisites: 1-FYZ-231/22 Úvod do modernej fyziky (Introduction to Modern Physics Course)	
Course requirements: Grades obtained during the semester are based on solutions to 10 or 11 homework problem sets and midterm exam Final Exam: written exam Marks: A 70%+ max grade, B 60%+ max grade, C 50%+ max grade, D 40%+ max grade, E 33%+ max grade Scale of assessment (preliminary/final): 40/60	
Learning outcomes: Learning the basic ideas of quantum mechanics and limitations of macroscopic classical physics. Acquiring knowledge of elementary mathematical formalism and problem solving skills. Developing physics thinking required to control quantum systems.	
Class syllabus: Introduction: from the "one meter" dimension to the dimension of atoms. Atomic nuclei, nucleons and quarks. Standard Model of elementary particles. Uncertainty principle. Stability of atoms and origin of their typical size and typical binding energy. Typical size and typical binding energy of the atomic nucleus. Basic concepts of elementary quantum mechanics: wave function and operators. Wave function and mathematical description of a double-slit experiment with electrons. The principle of superposition. Measurement in quantum mechanics. Particle in an infinite well. Physical significance and properties of the wave function. Free particle. Wave packets based on the principle of superposition to describe a free particle. Time-dependent and time-independent Schrodinger equations. Stationary states. Linear and Hermitian operators acting on the space of wave functions. Properties of Hermitian operators. Operators corresponding to simple	

<p>physical quantities known from classical physics. Commutator and its significance. Derivation of the uncertainty principle. Time evolution of the general wave function and time evolution of the mean values of physical quantities. Exact derivation of bound state solutions of simple quantum systems and their properties. The final potential well and its graphical solution. A simple harmonic oscillator and ladder operators (i) in the representation of wave functions, (ii) in the general Dirac bra / ket formalism, (iii) in the energy representation. Angular momentum: eigenvalues and eigenfunctions. Properties of spherical harmonics. Derivation of the exact solution for a hydrogen atom (Coulomb potential) and properties of the wave functions of the ground state and lowest excited states. Spin. Stern-Gerlach experiment. Orbital vs. spin angular momentum of the electron. Spin description formalism: spinors and 2x2 Hermitian matrices corresponding to the spin projection operators on the x, y, z axes and on the axis given by a general unit vector. Pauli matrices and their properties, their eigenvalues and eigenvectors. Spin precession in an external homogeneous magnetic field. Time-independent perturbation theory for non-degenerate states as an example of an approximate method for solving the time-independent Schrodinger equation. Usefulness of the method and convergence criteria. Derivation and properties of the solution in the first-order perturbation theory. Motivation for the second order. Energy levels in the second-order perturbation theory - derivation and examples.</p>

COURSE DESCRIPTION

Academic year: 2021/2022					
University: Comenius University Bratislava					
Faculty: Faculty of Mathematics, Physics and Informatics					
Course ID: FMFL.KTF/1-FYZ-265/15		Course title: Theory of the Electromagnetic Field			
Educational activities: Type of activities: lecture / practicals Number of hours: per week: 4 / 2 per level/semester: 52 / 26 Form of the course: on-site learning					
Number of credits: 6					
Recommended semester: 4.					
Educational level: I.
