

## Course descriptions

### TABLE OF CONTENTS

|                  |                                                                              |    |
|------------------|------------------------------------------------------------------------------|----|
| 1. 3-MAM-002/15  | Analysis of Models in Financial Mathematics.....                             | 2  |
| 2. 3-MAM-036/25  | Applied Graph Theory.....                                                    | 3  |
| 3. 3-MAM-014/00  | Asymptotic Methods.....                                                      | 5  |
| 4. 3-MAM-005/00  | Biomathematics.....                                                          | 7  |
| 5. 3-MXX-101/15  | Course of English for PhD Studies (1).....                                   | 9  |
| 6. 3-MXX-102/15  | Course of English for PhD Studies (1).....                                   | 10 |
| 7. 3-MAM-806/15  | Creation of Teaching Texts and Aids.....                                     | 11 |
| 8. 3-MAM-203/10  | Department Seminar (1).....                                                  | 12 |
| 9. 3-MAM-204/10  | Department Seminar (2).....                                                  | 13 |
| 10. 3-MAM-205/10 | Department Seminar (3).....                                                  | 14 |
| 11. 3-MAM-206/10 | Department Seminar (4).....                                                  | 15 |
| 12. 3-MAM-990/15 | Dissertation Thesis Defense ( <b>state exam</b> ).....                       | 16 |
| 13. 3-MAM-031/15 | Fundamentals of Mathematical Modelling in Empirical Sciences.....            | 17 |
| 14. 3-MAM-803/15 | Guidance of a Final Thesis or of a Project for the Students' Conference..... | 18 |
| 15. 3-MAM-804/10 | Guidance of the Students' Research Project.....                              | 19 |
| 16. 3-MAM-101/15 | Individual Study of Science and Research Resources (1).....                  | 20 |
| 17. 3-MAM-104/15 | Individual Study of Science and Research Resources (2).....                  | 21 |
| 18. 3-MAM-001/15 | Interior-point methods in linear programming.....                            | 22 |
| 19. 3-MAM-035/24 | Introduction to Classification Methods.....                                  | 23 |
| 20. 3-MAM-009/15 | Models of Fluids Dynamics.....                                               | 25 |
| 21. 3-MAM-007/15 | Modern Methods of Convex Optimisation.....                                   | 27 |
| 22. 3-MAM-024/10 | Nonlinear Statistical Models.....                                            | 28 |
| 23. 3-MAM-037/25 | Numerical modelling transport processes.....                                 | 29 |
| 24. 3-MAM-701/15 | Obtaining the Comenius University Grant for the Young.....                   | 31 |
| 25. 3-MAM-805/10 | Participation in a Conference Organising Committee.....                      | 32 |
| 26. 3-MAM-950/15 | Passing Dissertation Examination ( <b>state exam</b> ).....                  | 33 |
| 27. 3-MAM-403/15 | Presentation at a Homeland Conference or Department Seminar.....             | 34 |
| 28. 3-MAM-401/15 | Presentation at an International Conference.....                             | 35 |
| 29. 3-MAM-018/10 | Probability Theory.....                                                      | 36 |
| 30. 3-MAM-302/15 | Publication in a Reviewed Periodical or Reviewed Almanac.....                | 37 |
| 31. 3-MAM-301/15 | Publication in an A-category Periodical.....                                 | 38 |
| 32. 3-MAM-030/15 | Random Dynamic Systems.....                                                  | 39 |
| 33. 3-MAM-706/15 | Response to a Publication.....                                               | 40 |
| 34. 3-MAM-704/15 | Response to a WoK- or SCOPUS-registered Publication.....                     | 41 |
| 35. 3-MAM-702/15 | Scientific Project Co-researcher.....                                        | 42 |
| 36. 3-MAM-003/00 | Selected Topics from Financial Mathematics.....                              | 43 |
| 37. 3-MAM-033/23 | Selected Topics from Survival Analysis.....                                  | 44 |
| 38. 3-MAM-025/10 | Simulation Methods.....                                                      | 46 |
| 39. 3-MAM-019/10 | Stochastic Models in Insurance and Actuarial Science.....                    | 48 |
| 40. 3-MAM-807/10 | Study Stay Abroad.....                                                       | 50 |
| 41. 3-MAM-802/15 | Teaching Practice in the Summer Semester.....                                | 51 |
| 42. 3-MAM-801/15 | Teaching Practice in the Winter Semester.....                                | 52 |
| 43. 3-MAM-034/24 | Theory of Dynamic Equations and Inequalities on Time scales.....             | 53 |
| 44. 3-MAM-808/15 | Writing Final Thesis Assessment Protocol.....                                | 55 |

## COURSE DESCRIPTION

|                                                                                                                                                                                                    |                                                                     |

| <b>Course requirements:</b><br>Interim assessment during the semester has a weight of 30% (homeworks 20%, bonus exercises 10%). The two semester exam papers have a total weight of 70% (the first paper taken in the middle of the semester, the second paper taken at the end of the semester). The student must obtain at least half of the points from each semester exam paper. The final evaluation can be adjusted by an oral exam (theoretical questions, written preparation).<br>Grading: A (100-91), B (90-81), C (80-71), D (70-61), E (60-51), FX (50-0)<br>Scale of assessment (preliminary/final): 30/70 |                                            |
| <b>Learning outcomes:</b><br>To give an overview of basic asymptotic methods for solving algebraic and differential problems in applied mathematics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                            |

| <b>Learning outcomes:</b><br>Students will become familiar with the theory and techniques used in current research in mathematical biology and in mathematical models in the natural and social sciences in general. At the same time, students try to work on a separate project in this area. They will also gain new knowledge from population models, chemical kinetics and cell biology.                                                                                                                                                                       |                                        |
| <b>Class syllabus:</b><br>Principles of mathematical modeling, modeling goals, model building, model simulations, parameter selection, non-dimensionalization, model robustness, results analysis. Biochemical kinetics, enzymatic reactions, cooperativity, quasi-stationary approximation. Epidemiological models. Dynamics on neural and other cell membranes, Hodgkin-Huxley model, Fitzhugh-Nagumo model.                                                                                                                                                      |                                        |

| <b>Course requirements:</b><br>Final exam will be oral.<br>The questions on the final exam will be from the topics presented during the course.<br>Grade scale: A 90%, B 80%, C 70%, D 60%, E 50%<br>Scale of assessment (preliminary/final): Weight of work during semester / final exam: Practical work during semester 80% / final exam 20%.                                                                                                                                                                                                                                              |                                                                |
| <b>Learning outcomes:</b><br>After completion of this class the students will be acquainted with classification methods from statistics and machine learning, as well as with mathematical principles on which they are based.                                                                                                                                                                                                                                                                                                                                                               |                                                                |
| <b>Class syllabus:</b><br>Students will present shorter parts of a monograph, and thus for continuity they will need to understand the preceding parts as well. Individual parts will have scope of not exceeding one meeting. In case of smaller number of enrolled students, the teacher will present material from the monograph as well.<br>Covered topics include: concept of a classification model, evaluation of models, linear and tree models, linear discriminant analysis (LDA), logistic regression, inference about statistical models, crossentropy, support vector machines. |                                                                |

| <b>Course requirements:</b><br>Interim assessment during the semester has a weight of 30% (homeworks 20%, bonus exercises 10%). The two semester exam papers have a total weight of 70% (the first paper taken in the middle of the semester, the second paper taken at the end of the semester). The student must obtain at least half of the points from each semester exam paper. The final evaluation can be adjusted by an oral exam (theoretical questions, written preparation).<br>Grading: A (100-91), B (90-81), C (80-71), D (70-61), E (60-51), FX (50-0)<br>Scale of assessment (preliminary/final): 30/70                                                                              |                                                   |
| <b>Learning outcomes:</b><br>Teach the students to derive and analyse basic equations describing fluid flow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                   |
| <b>Class syllabus:</b><br>Equations of motion for ideal fluids. Vorticity. Irrotational flow. Vorticity equation.<br>Equations of motion for viscous fluids. Examples of simple viscous flows. Flows with circular streamlines.<br>Convection and diffusion of vorticity. Gravity waves. Dispersion and group velocity. Surface tension effects and capillary waves.<br>Internal gravity waves. Waves with finite amplitude. Hydraulic shocks and solitary waves. Kelvin--Helmholtz instability. Thermal convection. Centrifugal instability. Theorem on the stability of shear flow. General theorem on the stability of viscous flow. Uniqueness of steady viscous flow. Transition to turbulence. |                                                   |

| <b>Learning outcomes:</b><br>Students are introduced to the finite volume method for the numerical solution of partial differential equations describing diffusion and advection problems in applied mathematics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                 |
| <b>Class syllabus:</b><br>Introduction to the finite volume method<br>1. Discretization schemes for advection-diffusion equations (central, upwind and hybrid differencing schemes) 2. Properties of the discretization schemes (conservativeness, boundedness and transportiveness) 3. Solution algorithms for pressure-velocity coupling (SIMPLE and PISO algorithms) 4. Direct and iterative methods for solving discretised equations (TDMA, Jacobi and Gauss–Seidel methods) Application of OpenFOAM® software in solving fluid dynamics problems 5. The heat transfer equation 6. The Navier–Stokes equations for single-phase incompressible flows 7. Lid-driven cavity flow 8. Poiseuille flow Meshing for complex geometries with OpenFOAM® 9. Flow around a cylinder. Von Kármán vortex street 10. Single-phase flow in the pore space. Scalar and particulate transport in the pore space Application of OpenFOAM® software in solving problems in financial mathematics and biomathematics 11. The Black–Scholes equation for option pricing 12. The Fisher–KPP equation for population dynamics |                                                                 |

| <b>Learning outcomes:</b><br>Students will gain knowledge on selected statistical methods in survival analysis and how to use them when analyzing censored data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                |
| <b>Class syllabus:</b><br>Censoring, survival function and hazard function. Discrete time models. Nonparametric estimates. Kaplan-Meier estimate. Comparing two survival datasets. Log-rank test. Wilcoxon test. Proportional hazards model. Likelihood function for proportional hazards model parameters. Weibull model as a proportional hazards model. Log-linear form of the Weibull distribution. More distributions used in survival analysis. Diagnostics in proportional hazards model. Cox-Snell residuals. Martingale residuals. Aft (accelerated failure time) models. Cox regression model. Models with time-dependent explanatory variables. |                                                                |

| <b>Prerequisites:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                              |
| <b>Course requirements:</b><br>During the semester the student can get 100% points for one written exam, which is usually written at the end of the semester.<br>Grade thresholds: A: 100.00% – 90.00%; B: 89.99% – 80.00%; C: 79.99% – 70.00%; D: 69.99% – 60.00%; E: 59.99% – 50.00%; Fx: 49.99% – 0.00%.<br>Scale of assessment (preliminary/final): Practical work during semester 100% / final exam 0%.                                                                                        |                                                                              |
| <b>Learning outcomes:</b><br>After completing the course, the student will gain a detailed overview of ruin theory and the Cramér-Lundberg model. He or she will be able to approximate the ruin probability of the insurance company even if the claim size distribution has a heavy right tail. In addition, the student will know the various generalizations of the strong law of large numbers that are used in the field of non-life insurance.                                               |                                                                              |
| <b>Class syllabus:</b><br>Probability distributions of small and large claims. Heavy tailed probability distributions: subexponential distributions, long tailed distributions, regularly varying distributions, distributions with fat tails. Risk process in non-life insurance. Cramér-Lundberg model, Cramér-Lundberg theorem. Probability of ruin of an insurance company in finite and infinite time. Generalized versions of the strong law of large numbers. Law of the iterated logarithm. |                                                                              |
