Educational activities: Type of activities: practicals / lecture Number of hours: per week: 2 / 2 per level/semester: 26 / 26 Form of the course: on-site learning	
Number of credits: 5	
Recommended semester: 1.	
Educational level: I., II.	
Prerequisites:	
Course requirements: Continuous evaluation: the course is scored, the maximum number of points for the course is 150. The student gains continuous (weekly) points for solved problem tasks (70 pts), two interim tests (20 pts total), solved project (20 pts), active work during the semester (10 pts), and for solving assigned programming problems on the exam (30 pts). The student must earn a minimum of 58 points during the semester. Detailed grading requirements will be specified by the instructor at the beginning of the semester. Exam: In the form of solving a set of programming problems at the computer. A 92%, B 84%, C 76%, D 68%, E 60%. Scale of assessment (preliminary/final): 70/30 The results of problems solved and active participation in seminars are counted towards the final maximum of 60 points a student can earn during the semester. An additional 10 points can be earned for completing a more complex research-oriented project (within a specified time, essentially before the final exam). The remaining 30 points is the maximum possible score for solving a set of problems on the exam. The time for solving it is usually 120 minutes, directly behind the computer.	
Learning outcomes: Develop a systematic understanding of the basics of programming in a programming language appropriate to the state of knowledge. Develop understanding of basic programming concepts and practices that is characterized by the ability to: <ul style="list-style-type: none"> · program the solution of a given problem, explain the function of the individual elements in it at the level of commands, control structures and the whole. Explain the strategy (algorithm) of the learner's solution, debug the solution, know how to modify it according to the requirements, · analyse the program code (created by themselves or by someone else), verify its behaviour, recognise the basic concepts and procedures in it (also comparing it with other programming environments that students have already encountered in primary and secondary school, including programmable robotic building blocks and toys), · explore a programming solution (created by someone else) using the decomposition method, to verify its behaviour, in various cases, · compare and explain the differences in various solutions of the same or similar problem. 	
Class syllabus:	

the environment and options for direct control, the executor and its settings, the use and modification of settings,
 elements of the programming language, command with no input, command with one or more inputs, groups of commands and their execution and reexecution,
 creation of a user's command, its definition, use and modification, use of randomness, generation of random values and their use with various constraints,
 creating and using an expression as an input to a command,
 other control structures,
 conditions and visualizing their changing values, use of conditions in computation,
 working with multiple sprites, cooperation and communication between multiple sprites, programmed animations,
 requested input and working with input value; variable and working with it,
 creating and using composite data, working with a list, data visualisation
