COURSE DESCRIPTION

Academic year: 2025/2026	
University: Comenius University Bratislava	
Faculty: Faculty of Natural Sciences	
Course ID: PriF.KGP/N-mGZL-021/23	Course title: Sedimentology of siliceous sedimentary rocks
Educational activities: Type of activities: practicals / lecture Number of hours: per week: 4 / 3 per level/semester: 52 / 39 Form of the course: on-site learning	
Number of credits: 6	
Recommended semester: 2., 4.	
Educational level: II.	
Prerequisites:	
Course requirements: The condition for passing the course is a full week's participation in the course and completed assignments for exercises within the course. A = 100 - 96 %, B = 95 - 87 %, C = 86 - 80 %, D = 79 - 65 %, E = 64 - 60 %. FX = less than 60%.	
Learning outcomes: By successfully completing the course, the students will acquire basic knowledge of how siliceous sedimentary systems look, how they were formed. Students will gain knowledge about the organisms forming siliceous tests in rock forming quantities and the interplay with carbonate production. Students will learn how to microfacially analyse siliceous sedimentary rocks. They will know how to distinguish the different siliceous rocks by their microfacies and determine their depositional environment with special focus on the organisms forming sediment, mostly radiolarians. Students will learn the interaction between production of siliceous and carbonate rocks and siliciclastic resp. volcanic events (e.g. changes in carbonate production, climate changes, oceanographic changes).	
Class syllabus: During the course students will get a strong background on the sedimentology of siliceous sedimentary rocks with special emphasis on their depositional environments. They will learn and discuss all topics related to the sedimentology of siliceous sedimentary rocks, their stratigraphy and depositional environment with special emphasis on the most common siliceous sedimentary rocks: radiolarites. Special focus will be placed on the Mesozoic successions of the Neotethys realm as they occur everywhere. These successions were deposited in Triassic to Early Jurassic times in a passive continental margin setting and the oceanic realm, and in Middle Jurassic to Late Jurassic in an active continental margin setting and the oceanic realm. In the Cretaceous times the situation changed due to the increase of carbonate producing plankton and the deposition of siliceous sediments became restricted to the oceanic realm. Mentioned geological settings will be discussed and reasoned based on practical evaluation of the study material.
